

## [WEB] Products Manager

Upon checking db.php, I notice:

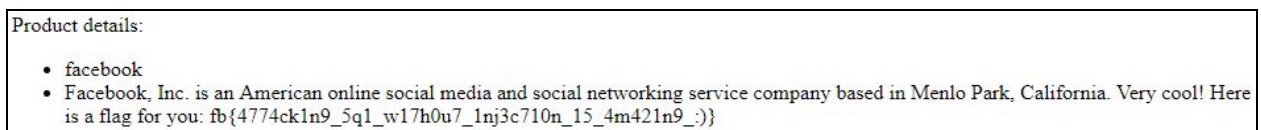

```
INSERT INTO products VALUES('facebook', sha256(...), 'FLAG_HERE');
```

The programmer uses prepare() functions which means sql injection cannot be done. But one thing that I learned about MySQL is that MySQL ignores trailing whitespaces when querying.

So, I created a “new” product with the following information:

Name: facebook (space)  
Secret: Facebookcool123  
Description: Facebookisfacebook

Then, I went to view the details of this “new” product using the information I just entered.

**flag:** fb{4774ck1n9\_5q1\_w17h0u7\_1nj3c710n\_15\_4m421n9\_:})
